

CineBook

Create the project, build it with a general AI agent, push the code to GitHub, and deploy it with GitHub Pages.

Step 1 - Create the folder

Windows: Create C:\Users\Jay\cinema.

Mac: Create a folder named cinema on the Desktop.

Step 2 - Open the folder

Open Visual Studio Code. Select **File > Open Folder**, choose the cinema folder, and click **Open**.

Step 3 - Build CineBook

Open the AI coding agent in the right-hand panel of Visual Studio Code. Select **Agent mode**, if available, and paste the complete prompt below.

Build prompt

Act as the lead coding agent.

Build a complete movie cinema ticket-booking web application called **CineBook**.

Create three agents. If separate agents are unavailable, perform the roles sequentially.

Agent 1 - Frontend

- Create movie, cinema, showtime, seat-selection, payment, and confirmation screens.
- Show available, selected, and booked seats.
- Make the application responsive.

Agent 2 - Backend

- Store movies, cinemas, showtimes, seats, customers, and bookings.
- Prevent the same seat from being booked twice for the same showtime.
- Generate a unique booking reference.
- Return a clear error when a seat is unavailable.

Agent 3 - QA

- Test the complete booking process.
- Test booking the same seat twice.
- Verify ticket totals.
- Test desktop and mobile layouts.
- Fix discovered problems.

Keep all files inside the current cinema folder. Use simulated payments, create a README, run the tests, and continue until the application works completely.

GitHub and Deployment

Continue after the application has been built and tested.

Step 4 - Create a GitHub repository

Go to github.com and sign in. Click + > **New repository**. Enter cinebook, click **Create repository**, and copy the HTTPS repository link.

Step 5 - Push the code to GitHub

Return to the Visual Studio Code AI box. Paste the instruction below and replace the example address with your repository link.

```
Push the current project code to this GitHub repository:
```

```
https://github.com/YOUR-USERNAME/cinebook.git
```

```
Use the main branch and confirm when the push is complete.
```

Step 6 - Deploy using GitHub Pages

Open the cinebook repository on GitHub. Select **Settings > Pages**. Under **Build and deployment**, choose the deployment source prepared by the coding agent. For a basic static website, select **Deploy from a branch**, choose main and /(root), then click **Save**.

Wait for GitHub to publish the site, then open the website address displayed on the Pages screen.

Important: GitHub Pages hosts static frontend files. A separate backend server or database must be hosted elsewhere.

Step 7 - If GitHub Pages does not show a link

Take a screenshot of the GitHub Pages screen and paste it into the Visual Studio Code AI chat. Then paste this prompt:

```
Review the attached screenshot of my GitHub Pages screen. Modify the project code and GitHub Pages settings as needed, then deploy the site and give me the working GitHub Pages link.
```
